Chapter 6. 2-D and 3-D Plotting and Animation
6.1 Introduction
6.2 Anatomy of a 2-D (x–y) Plot in MATLAB
6.3 Line Specifications
6.4 Accessing and Modifying Properties of the Graphics Objects
6.5 Text Annotations
6.6 Overlays, Legends, Subplots, and Multiple Figures
6.7 2-D Plotting Functions
6.8 3-D Plotting Functions
6.9 Changing Color Palette
6.10 Easy-to-Use Plotting Functions
6.11 Plot Editing
6.12 Interactive Plotting and Animation
6.13 Requirements to Engineering Plots
Plot’s Anatomy

```matlab
figure
axis
line
ezplot('sin(x)')
title
xlabel
xticks
xticklabels
```

**Axes toolbar:**
- Save / Copy
- Brush/Select Data
- Data Tips
- Pan
- Zoom In
- Zoom Out
- Restore View

Default line color: [0.00,0.45,0.74]
(before R2014b used to be [0,0,1])
### Plotting Functions Difference

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>plot(X,Y,...)</code></td>
<td>- creates a 2-D plot of data in Y versus the corresponding values in X (this function also creates the figure, axes and line objects)</td>
</tr>
<tr>
<td><code>line(X,Y,...)</code></td>
<td>- adds a line defined by vectors X and Y (or multiple lines if either X and Y, or both are matrices) to the current axes. Unlike the <code>plot</code> function, <code>line</code> does not delete other graphics objects or reset axes properties</td>
</tr>
<tr>
<td><code>ezplot(f,...)</code></td>
<td>- plots symbolic expression, equation, or function ( f(x) ) or ( f(x, y) ). The default range for ( x ) or both ( x ) and ( y ) is ([-2\pi; 2\pi])</td>
</tr>
<tr>
<td><code>ezplot(funx,funy,...)</code></td>
<td>- plots the parametrically defined planar curve ( x = \text{fun}_x(t) ) and ( y = \text{fun}_y(t) ) over the default range ( 0 \leq t \leq 2\pi ) (similar function: <code>ezplot3</code>)</td>
</tr>
<tr>
<td><code>fplot(f,...)</code></td>
<td>- plots the curve defined by the function ( y = f(x) ) over the default interval ([-5; 5]) for ( x ) (similar functions: <code>fsurf</code>, introduced in R2016a)</td>
</tr>
<tr>
<td><code>fplot(funx,funy,...)</code></td>
<td>- plots the curve defined parametrically, as ( x = f_x(t) ) and ( y = f_y(t) ), over the default interval ([-5; 5]) for ( x ) (similar functions: <code>fplot3</code> and <code>fsurf</code>, both introduced in R2016a)</td>
</tr>
<tr>
<td><code>fimplicit(f,...)</code></td>
<td>- plots the implicit function ( f(x,y) = 0 ) defined by a function handle ( f ) over the default interval ([-5; 5]) for ( x ) and ( y ) (introduced in R2016b) (similar functions <code>fcontour</code> and <code>fimplicit3</code>, introduced in R2016a and R2016b, respectively)</td>
</tr>

Plotting Basics

```matlab
x=0:pi/20:pi;  x=linspace(0,pi,20);
y=sin(x);        y=sin(x);
plot(x,y)       plot(x,y)
plot(0:pi/20:pi,sin(0:pi/20:pi))
line(0:pi/20:pi,sin(0:pi/20:pi))
fplot(@(x)sin(x),[0,pi])
```
ezplot('\text{sin}(x) + \text{sin}(y) - \text{sin}(x\cdot y)')
grid, axis equal

\text{fimplicit}@((x,y) \sin(x) + \sin(y) - \text{sin}(x\cdot y), ... \\
2\pi*[-1 1 -1 1])
grid, axis equal

fplot(@{(t)\sin(2^{*}t)}, @(t)\sin(2.5^{*}t))
grid, axis equal

\text{f(x)}\ f(x,y)=0 \ x(t), y(t)

ax=gca;
S=sym(ax.XLim(1):pi/2:ax.XLim(2));
ax.XTick=double(S);
ax.XTickLabel=arrayfun(@texlabel, S, 'UniformOutput', false);

Try this code to change the x-axis tick labels
### Enhancing Plot Readability

axis([xmin xmax ymin ymax]) – sets the minimum and maximum limits of the x- and y-axes. (If you want to specify just one limit but want MATLAB to autoscale the other, use Inf or –Inf for autoscaled limits, or use xlim and ylim functions.) You may also use one of the following:

- **axis square** – selects the axes’ limits so that the plot will be square
- **axis equal** – assures that x-and y-axes have same tick mark spacing
- **axis tight** – sets the limits to the range of the data
- **axis vis3d** – freezes aspect ratio properties to enable rotation of 3-D objects and overrides stretch-to-fill
- **axis manual** – freezes the scaling at the current limits
- **axis auto** – returns axis scaling to its default autoscaling mode
- **axis ij** – reverses a direction of the y-axis with the values increasing top to bottom

\( v = \text{axis} \) – returns the current axis scaling in the vector v (so that you might use the same scaling for another plot by calling axis(v))

axis off – turns visibility of axes lines and background off

---

grid – displays gridlines at the tick marks corresponding to the tick labels. Use grid on to turn on gridlines and grid off to turn off grid lines. When used by itself, grid toggles the grid switch on or off.

grid minor – toggles the visibility of the minor grid lines (not, not all types of charts support it)
Enhancing Plot Readability

- `title('text')` – places text in a title at the top of a plot
- `title('First line';'Second line')` - creates a two-line title
- `sgtitle('text')` – adds a title above the grid of subplots in the current figure (
introduced in R2018b)

- `xlabel('text')` – places a text label on the x-axis (abscissa)
- `ylabel('text')` – places a text label on the y-axis (ordinate)

- `text(x,y,'text')` – adds the text in the quotes to location \((x,y)\) on the current axes
- `gtext('text')` – places the text in Figure window at a point specified by the mouse click

- `annotation(annotation_type)` – creates the specified annotation type, such as line, arrow,
double arrow, text arrow, textbox, ellipse, and rectangle

- `xticks(ticks)` – sets the x-axis tick values for the current axis as a vector of increasing
numeric numbers, ticks, specifying locations along the x-axis where the
tick marks appear. Similarly, the `yticks` and `zticks` functions are available

- `xticklabels(labels)` – sets the x-axis tick labels for the current axes as a string array or a cell
array of character vectors labels. Also, see `xtickangle` and `xtickformat`. Similar functions exist for y- and z-axis

grid, axis, and Annotations

>> t=linspace(0,2*pi);
>> line(cos(t),sin(t)), grid on

>> t=linspace(0,2*pi);
>> line(cos(t),sin(t)), axis equal

>> title('My Plot')
>> xlabel('x-axis'), ylabel('y-axis')
>> text(0.5,0.5,'Text')

>> annotation('arrow',[0.5 0.7],[0.7 0.8])
>> gtext('Chosen Location')

Note, by default, the annotation units are normalized to the figure. The lower left corner of the figure maps to (0,0) and the upper right corner maps to (1,1)

Line type annotations: 'line','arrow','doublearrow','textarrow'
Shape type annotations: 'rectangle','ellipse','textbox'

Text Strings Modifiers

Stream modifiers:
- \bf - bold font
- \it - italics font
- \sl - oblique font (rarely available)
- \rm - normal font
- \fontname{fontname} - specify the name of the font family to use
- \fontsize{fontsize} - specify the font size (in font units)

(The first four modifiers are mutually exclusive. Stream modifiers remain in effect until the end of the string or only within the context defined by braces {}.)

The subscript character “_” and the superscript character “^” modify the character or substring defined in braces immediately following.

To print the special characters used to define the TeX strings when Interpreter is TeX, prefix them with the backslash “\” character, for instance: \ll, \{, \}, \_\_, \^.

Adding Equations to the Plot

```matlab
fplot('0.25*exp(-0.006*t)*sin(0.2*t)',[0 900])
a='\fontsize{12}{12}\fontfamily{it}
\text{AE}^{-\text{A}}\text{t}\sin\beta\text{t}';
b='\alpha<\beta';
title(strcat(a,b))
xlabel('\textbf{itTime}\text{\,musec}')
ylabel('\textfont{12}\text{Amplitude}')
t1='
\Delta\tau=\frac{\tau_f}{N-1}';
text(0.1,0.7,['$$'$ t1 '$$$'],...
    'Interpreter','latex')
t2=['\textbf{A}_1=\left[
\begin{array}{cc}
-1&0
\\
1&-1
\\
-1&0
\end{array}\right]';
text(0.35,0.7,['$$'$ t2 '$$$'],...
    'Interpreter','latex')
t3=['\dot{x}(t)=\frac{dx}{d\tau}\frac{d\tau}{dt}=x''(\tau)\lambda(\tau)'];
text(0.65,0.7,['$$'$ t3 '$$$'],...
    'Interpreter','latex')
axis off
```

You may also try `text(750,-0.2,texlabel('beta12*e^{-alpha*t}'))`, which uses the `texlabel` function to convert Greek variable names into a character vector that is displayed as Greek letters.
Examples of using LaTeX Syntax

The easiest way to visualize what additional capabilities the LaTeX interpreter of MATLAB offers is to click on the Insert equation icon of the Live Editor’s Insert tab, which opens the Equation tab.
>>> x=linspace(0,pi); xm=linspace(0,pi,20);
>>> plot(x,cos(6*x).*exp(-x),xm,cos(6*xm).*exp(-xm),'^')

>>> x=linspace(0,pi);
plot(x,cos(6*x).*exp(-x),'b.--')

>>> x=-pi:pi;
y=sin(x);
plot(x,y.^2,'--sb','MarkerSize',10,...
'MarkerFaceColor','r')

>>> x=-pi:pi;
y=sin(x);
p=line(x,y,'Color','r','Marker','p',...
'LineWidth',3,'MarkerSize',7)
datatip(p,'DataIndex',5,'Location','southeast');
## LineSpec Options

### plot(x,y,LineSpec)

<table>
<thead>
<tr>

<td></td>
</tr>
<tr>
<td></td>
<td>Down triangle (▼)</td>
<td></td>
</tr>
</tbody>
</table>

† Note that circle and all following markers are filled markers (you may fill them with color)

- **LineWidth** – specifies the width of the line (in points)
- **MarkerEdgeColor** – specifies the color of the marker or the edge color for filled markers
- **MarkerFaceColor** – specifies the color of the face of filled markers
- **MarkerSize** – specifies the size of the marker (in points)

```matlab
plot(x,y,'m--h','LineWidth',3)
```

Multiple Plots and Line Specifications

```matlab
x=0:pi/20:pi;
y1=sin(x); y2=cos(x);
plot(x,y1), hold on
plot(x,y2)
legend('sin','cos')
```

```matlab
x=0:pi/20:pi;
y1=sin(x); y2=cos(x);
plot(x,y1,x,y2)
legend('sin','cos')
```

```matlab
x=0:pi/20:pi;
y1=sin(x); y2=cos(x);
plot(x,y1,x,y2,'-.sm')
legend('sin','cos')
```

Line colors are automatically cycled

Adding Reference Lines

The Statistics and Machine Learning Toolbox features `refline` and `refcurve` for adding a straight line or polynomial in the current axis, `lsline` superimposing a least-squares line on each scatter plot, and `gline` drawing a line segment by clicking the pointer at the two endpoints.

What about basic MATLAB?

```matlab
function y=horline(Y,sp)
    def='k--';
    if nargin==0; Y=0; end % no input arguments
    if nargin<=1; sp=def; end % less than two input arg.
    linecolors='rgbcmykw'; % define line colors
    [c,n]=intersect(sp,linecolors); % find color spec.
    if isempty(n), c=def(1); else, sp(n)=[]; end % no color
    if isempty(sp), sp=def(2:3); end % no line style
    yy=xlim; % find x-limits
    line(yy,Y*[1 1],'

```
legend(lbl1,...,lbln,['Location',Lcn]) adds a legend with legend with lbl1, ..., lbln text strings in the specified location, Lcn, with respect to the axes, where Lcn may be one of the following character vectors (or string scalars):

- 'North' ('n') inside plot box near top
- 'South' ('s') inside bottom
- 'East' ('e') inside right
- 'West' ('w') inside left
- 'NorthEast' ('ne') inside top right (default)
- 'NorthWest' ('nw') inside top left
- 'SouthEast' ('se') inside bottom right
- 'SouthWest' ('sw') inside bottom left
- 'NorthOutside' ('no') outside plot box near top
- 'SouthOutside' ('so') outside bottom
- 'EastOutside' ('eo') outside right
- 'WestOutside' ('wo') outside left
- 'NorthEastOutside' ('neo') outside top right
- 'NorthWestOutside' ('nwo') outside top left
- 'SouthEastOutside' ('seo') outside bottom right
- 'SouthWestOutside' ('swo') outside bottom left
- 'Best' ('b') least conflict with data in plot
- 'BestOutside' ('bo') least unused space outside plot

All rights reserved. No part of this publication may be reproduced, distributed, or transmitted, unless for course participation, in any form or by any means, or stored in a database or retrieval system, without the prior written permission of the Publisher and/or Author. Contact the American Institute of Aeronautics and Astronautics, Professional Development Programs, 12700 Sunrise Valley Drive, Suite 200, Reston, VA 20191-5807.
Legend Options

legend(subset,labels,...)

legend([GrObj1, GrObj2, ...],labels,...)

legend(...,'Color','y','TextColor','r', ...
'NumColumns',2,'Box','off', ... 
'Orientation','horizontal', ... 
'AutoUpdate','off')

Only includes items in the legend for the data series listed in a vector of graphics objects subset (labels can be a single cell array of character vectors, a string array, or a character array labels)

If needed, you can create the group objects (which includes multiple graphics objects, as a child of the current axes) using the hgroup function

Specifies label properties via name-value pair arguments

```matlab
h1=fplot(@sin,'-.'); hold
fplot(@(x)sin(x).*cos(x),'.');
h2=fplot(@cos,'--');
legend([h1 h2],{"sin(x)" "cos(x)"})
hlgd=findall(gcf,'type','legend');
hlgd.AutoUpdate='off';
fplot(@(x)sin(x)+cos(x))
```
Legend Behavior

Starting from R2017a, the legend automatically updates when you add or remove data series from the axes, unless... you set the 'AutoUpdate' property of the legend to 'off'.

```matlab
h1=fplot(@sin,'-.'); hold
fplot(@(x)sin(x).*cos(x),'-:');

h2=fplot(@cos,'--');
legend([h1 h2],{"sin(x)" "cos(x)"},'AutoUpdate','off')
fplot(@(x)sin(x)+cos(x))

hlgd=findall(gcf,'type','legend')
hlgd.Color='y';
```
x=linspace(0,15,200);
y1=10*exp(-0.36*x).*sin(2.7*x);
y2=200*exp(-0.05*x).*sin(0.8*x);
[ax,h1,h2]=plotyy(x,y1,x,y2);
set(get(ax(1),'Ylabel'),'String','Short Period Motion (\alpha, ^o)');
set(get(ax(2),'Ylabel'),'String','Phugoid Motion (h, ft)');
set(h2,'LineStyle',':');
xlabel('Time, s')
title('T-37 Longitudinal Dynamics')

Prior to R2014b

Starting from R2016a

All rights reserved. No part of this publication may be reproduced, distributed, or transmitted, unless for course participation, in any form or by any means, or stored in a database or retrieval system, without the prior written permission of the Publisher and/or Author. Contact the American Institute of Aeronautics and Astronautics, Professional Development Programs, 12700 Sunrise Valley Drive, Suite 200, Reston, VA 20191-5807.
Finding a Graphics Object

```matlab
>> x = linspace(-pi,pi,50);
>> hp = plot(x,sin(x),'b-',x,cos(x),'rp',x,sin(x).*cos(x),'m+:');
>> legend([hp(1) hp(3)],'f_1=sin(x)','f_2=sin(x)*cos(x)','location','se')
```

```matlab
>> h1 = findobj('Marker','p');
>> delete(h1)
>> h2 = findobj('Tag','legend');
>> set(h2,'Color','g')
```

Comments:

a) The `findobj` call returns handles of the root object and all its descendants
b) The `get(gcf,'children')` call returns 2-by-1 graphics array composed of the Legend and Axes objects
c) Try `allchild(gcf), findall(gcf), allchild(gca), and findall(gca)`
The subplot Function

```matlab
subplot(2,2,1), ezplot('sin(x)')
subplot(2,2,2), ezplot('cos(x)')
subplot(2,2,3), ezplot('sin(x).^2')
subplot(2,2,4), ezplot('cos(x).^2')
```
The `tiledlayout` Function

Introduced in R2019b

tiledlayout(2,2);
t=linspace(-2*pi,2*pi);
nexttile, plot(t,sin(t))
nexttile, plot(t,cos(t))
nexttile, plot(t,sin(t).^2)
nexttile, plot(t,cos(t).^2)

tiledlayout(2,2,'TileSpacing','compact')

In R2019b – this construct did not work with the `ez...` and `f...` families of functions. It is fixed now!
tiledlayout(2,2)
nexttile, ezplot('sin(x)')
nexttile, ezplot('cos(x)')
nexttile, ezplot('sin(x).^2')
nexttile, ezplot('cos(x).^2')
When working with Cartesian axes

Variety of the 2-D Plots

- stem
- stairs
- loglog
- semilogx
- semilogy
- scatter
- errorbar
- polarplot
- compass
- polarhistogram
- polaraxes
- feather
- area
- pie
- fill
- rectangle
Variety of the 2-D Plots

- `barh`
- `histogram`
- `plotmatrix`
- `binscatter`
- `histogram2` (view(2))
- `contour`
- `geoplot`
- `geobubble`
- `triplot`
- `stackedplot`
- `parallelplot`
- `heatmap`
- `wordcloud`
```matlab
P=[-10000 1
-8000 5
-6500 5
...];

% Defining axes using the subplot function
subplot 211
    plot(P(:,1),P(:,2)/1000,'o-','markersize',3), grid, hold
    plot(P(end-2:end,1),P(end-2:end,2)/1000,'pr','markersize',6)
    xlabel('Year'), ylabel('Population, billion')
    xlim([-8000 2100])
    set(gca,'Color',[0.98 0.98 0.85]);
subplot 212
    plot(P(2:end,1),diff(P(:,2))./diff(P(:,1)),'o-','markersize',3), grid, hold
    plot(P(end-1:end,1),diff(P(end-2:end,2))./diff(P(end-2:end,1)),'pr','markersize',6)
    xlim([-8000 2100])
xlabel('Year'), ylabel('Yearly increase, million')
set(gca,'Color',[0.98 0.98 0.85]);

% Explicitly-defined axes positions (for two insert plots)
ax1=axes('Position',[0.2 0.68 0.5 0.22]);
semilogy(ax1,P(:,1),P(:,2)/1000,'o-','markersize',2), grid, hold
semilogy(ax1,P(end-2:end,1),P(end-2:end,2)/1000,'pr','markersize',4)
xlim([-4000 2100]), ylabel('log scale, billion')
ax2=axes('Position',[0.2 0.20 0.5 0.22]);
semilogy(ax2,P(2:end,1),diff(P(:,2))./diff(P(:,1)),'o-','markersize',2), grid, hold
semilogy(ax2,P(end-1:end,1),diff(P(end-2:end,2))./diff(P(end-2:end,1)),'pr','markersize',4)
xlim([-4000 2100]), ylabel('log scale, million')
```

For advanced users, inserted (nested) plots are used to enhance the visualization of data in MATLAB/Simulink.
Overlaying One Plot over Another

generation=[1:5];
number=[4.2 33.6 42.7 9.5 1];
price=[0.1 0.2 1 30 150];
k=bar(generation,number,'y')
text(k.XEndPoints'-0.5,k.YEndPoints',num2str(number'))
xlabel('Generation')
ylabel('Number manufactured, thousands')

h1=gca;
% Setting the new axes atop the first ones
h2=axes('Position',get(h1,'Position'));
% Adding the second plot to the new axes
semilogy(generation,price,'LineWidth',3)
% Modifying second axes settings
set(h2,'Color','none','YAxisLocation',...  
    'right', 'XLim',get(h1,'XLim'), ...  
    'XTickLabel',[], 'TickLength',[0 0])
text(3.5,10,'Price','Rotation',58)
ylabel('Price, M$'), title('Jet Fighters')
The Polar Plots

- `polarplot`
- `polarscatter`
- `polarhistogram`
- `compass`

**Introduced in R2016b**

- `rlim` sets or queries the r-axis limits for polar axes
- `rticks` sets or queries the r-axis tick values
- `rticklabels` sets or queries the r-axis tick labels
- `rtickformat` specifies the r-axis tick label format
- `rtickangle` rotates the r-axis tick labels
- `thetalim` sets or queries the theta-axis limits for polar axes
- `thetaticks` sets or queries the theta-axis tick values
- `thetaticklabels` sets or queries the theta-axis tick labels
- `thetatickformat` specifies the theta-axis tick label format
- `polaraxes` creates polar axes

```matlab
theta = 0:0.01:2*pi;
rho = 10*sin(.5*theta).*cos(.5*theta+pi/2);
pax = polaraxes;
polarplot(theta, rho, 'r', 'LineWidth', 2);
pax.ThetaDir = 'clockwise';
pax.ThetaZeroLocation = 'top';
pax.FontSize = 12;
pax.ThetaColor = 'r';
rticks([1 5 9])
rticklabels({'r=1nmi', 'r=5nmi', 'r=9nmi'})
thetaticks(0:90:270)
thetaticklabels({'N', 'E', 'S', 'W'})
```
Two Types of 3-D Plots

Trajectories

t = 0:pi/50:10*pi;
plot3(sin(t),cos(t),t,'b')
grid on, axis square

t = 0:.1:10; y = exp(-(.1+i)*t);
stem3(real(y),imag(y),t,'b')
hold on
plot3(real(y),imag(y),t,'r')
hold off, view(-39.5,62)

Surfaces

[X,Y] = meshgrid(linspace(0,2*pi,100));
Z = sin(X).*cos(Y).^2;
plot3(X,Y,Z)
axis equal

view(az,el)
Variety of the Surface Plots

```
[X,Y]=meshgrid(linspace(0,2*pi,100)); Z=sin(X).*cos(Y);
```

- `mesh(X,Y,Z)`
- `meshc(X,Y,Z)`
- `meshz(X,Y,Z), hidden off`
- `surf(X,Y,Z)`
- `surfc(X,Y,Z)`
- `surfl(X,Y,Z)`

All these functions allow passing in just the grid vectors as the first two arguments (i.e. not necessarily a full grid matrices)
Variety of the Surface Plots

\[
[X,Y]=\text{meshgrid}(\text{linspace}(0,2\pi,100)); \ Z=\sin(X)\cdot\cos(Y);
\]

\[
x=\text{rand}(1,500); \ y=\text{rand}(1,500); \ tri=\text{delaunay}(x,y);
\]
\[
z=\text{peaks}(6\cdot x-3,6\cdot y-3);
\]

\[
\text{ribbon}(Y,Z) \quad \text{waterfall}(X,Y,Z) \quad \text{tetramesh}
\]

\[
\text{trimesh}(tri,x,y,z) \quad \text{trisurf}(tri,x,y,z) \quad \text{trisurf}
\]
Similarities in 2-D and 3-D

quiver

Linking Multiple Axes

Equating axes limits using the axis function

```
[x,y]=meshgrid(-3:1/8:3); z=peaks(x,y);
fig = figure;
set(fig,'NumberTitle',false,'Unit','normalized','Position',[0 0 1 1]);

subplot(231), meshc(x,y,z), title('meshc')
axis([-3 3 -3 3 -10 5]); v=axis; hidden off
subplot 232, meshz(x,y,z), axis(v); title('meshz')
ax=gca; ax.Clipping='off';
subplot 233, surf(x,y,z,'FaceAlpha',0.7)
axis(v), title('surf')
ax=gca; ax.Clipping='off';
subplot 234, surfl(x,y,z), shading interp,
axis(v), title('surfl')
subplot 235, waterfall(x,y,z-5), axis(v), title('waterfall')
subplot 236, ribbon(y,z)                         title('ribbon')
```

Equating axes limits using the linkaxes function

```
a(1)=subplot(211);
x=randi(19,100,1);
y=rand(100,1);
stem(x,y)
a(2)=subplot(212);
histogram(x)
linkaxes(a,'x')
linkaxes(a,'y')
linkaxes(a,'xy')
```

Also, see linkdata and linkprop functions
Shapes and Shades

The default is shading faceted

```
cylinder
h=findobj('Type','surface');
C=rand(size(get(h,'CData')));
set(h,'CData',C)
axis square

sphere(10)
hold on
[x,y,z]=sphere;
surf(x+2,y,z)
axis equal

ellipsoid(0,0,0,2,10,1)
hold, axis equal
[x,y,z]=cylinder(0.5,40);
surf(x,y,z+0.5)
shading interp
view([8,14])
colormap colorcube
```

cylinder(1,8)
hc=get(gca,'Children')
rotate(hc,[1 1 1],45)
set(hc,'FaceColor','g')
axis equal

t=linspace(0,pi,50);
[X,Y,Z]=cylinder(2+cos(t));
surf(X,Y,Z)
axis square
axis off

ellipsoid(0,0,0,2,2,1)
hold
h=get(gca,'Children');
rotate(h,[3 3 3],34)
z=get(h,'Zdata'); shading flat
set(h,'Zdata',z+2), axis equal
hs=mesh([-2 2; -2 2],...
[-2 -2; 2 2],2.5*ones(2));
set(hs,'FaceColor','c')
```

&\end{align*} \]
Surface and Patch Objects

Lighting

camlight('headlight'), camlight('right'), camlight('left') - creates a light at the camera position, right and up from camera (default), and left and up from camera, respectively

camlight(az,el), lightangle(az,el) - creates a light at the specified azimuth (az) and elevation (el) with respect to the camera position

camlight(..., 'style') - defines the style argument using one of the following two values:

  local (default) - the light is a point source that radiates from the location in all directions
  infinite - the light shines in parallel rays

lighting flat - produces uniform lighting across each of the faces of the faceted object

lighting gouraud - calculates the vertex normals and interpolates linearly across the curved faces

material shiny - the object has a high specular reflectance relative to the diffuse and ambient light, and the color of the specular light depends only on the color of the light source

material dull - the object reflects more diffuse light and has no specular highlights, but the color of the reflected light depends only on the light source

material metal - the object has a very high specular reflectance, very low ambient and diffuse reflectance, and the color of the reflected light depends on both the color of the light source and the color of the object

All rights reserved. Using Different Color Maps and `colormap` Editor

```matlab
[x,y]=meshgrid(linspace(0,2*pi,100));
z=sin(x).*cos(y).^2;
surf(x,y,z)
colormap('Cool')
axis equal
set(gca,'Visible','off')
```

After R2014b

```matlab
>> colormapeditor
```

After R2020b

```matlab
>> colororder(H)
```

(H is a three-column matrix of RGB triplets)
Creating a 3-D Object Using Patch Graphics

```matlab
fx=[6.6 5.3 2.3 1.5 -2 -2.5 -10 -10 0 5.3 5.3]'; % fuselage
fy=zeros(11,1);
fz=[1.2 1.7 1.9 1.2 1.2 2.6 1.1 0.7 -0.2 0.3 0.8]';
   cx=[2.3 0 -2.5 -2 1.5]'; % cockpit canopy
   cy=zeros(5,1);

Property Editor (since R2018b)
Saving Plots

print ('Name','-djpeg')
print ('Name','-dtiff')
print ('Name','-dpdf')
Axes toolbar (after R2018b) was introduced in R2018b. By default it is composed of

- Export
- Brush
- Data Cursor
- Rotate (3-D)
- Pan
- Zoom In
- Zoom Out
- Restore View

The export options are

- Save As (PNG, JPEG, TIFF, PDF)
- Copy as image
- Copy as Vector Graphic

>> tb=axtoolbar(buttons)
Accessing Graphics Properties via Property Editor
plot(sin(0:pi/20:pi))

h_line = plot(sin(0:pi/20:pi));

get(h_line)

Prior to R2014b

Color: [0 0 1]
EraseMode: 'normal'
LineStyle: '-'
LineWidth: 0.5000
Marker: 'none'
MarkerSize: 6
MarkerEdgeColor: 'auto'
MarkerFaceColor: 'none'

...
Exploiting Parent – Children Relationship

Figure

Axis

Line

\( \text{h\_line} = \text{plot}(\sin(0:\pi/20:\pi)) \);

\( \text{gcf} \)

\( \text{h\_figure} = \text{get}(\text{gca}, 'parent') \)

\( \text{gca} \)

\( \text{h\_axis} = \text{get}(\text{h\_line}, 'parent') \)

\( \text{h\_figure} = \text{get}(\text{gca}, 'children') \)

\( \text{h\_figure} = \text{get}(\text{h\_axis}, 'parent') \)

\( \text{h\_axis} = \text{get}(\text{gcf}, 'children') \)

\( \text{h\_figure} = \text{get}(0, 'children') \)

\( \text{h\_figure} = \text{get}(0, 'CurrentFigure') \)

Comment: any object has a single parent, but may have several children, e.g. several axes (and legends) within one figure, several lines within one axis.
Changing Graphics Object Properties

Prior to R2014b

```matlab
h_line= plot(sin(0:pi/20:pi));
get(h_line)
```

Starting from R2014b

```matlab
set(H,'PropertyName',PropertyValue)
```

```matlab
h_line.Color='r';  h_line.LineWidth=2.5;
h_line.YData=5*h_line.YData;
```

Prior to R2014b

```matlab
set(h_line,'Color','r','LineWidth',2.5)
set(h_line,'ydata',get(h_line,'ydata')*5)
```
Creating Animations

% Defining a membrane

Graphical Input From Mouse

```matlab
axis([0 10 0 10]), hold on
xy = []; n = 0; % Initially, the list of points is empty
%% Picking up multiple points by clicking left mouse button
%   (Right mouse button means you are picking the last point)
but = 1;
while but == 1
    [xi, yi, but] = ginput(1);
    plot(xi, yi, 'ro')
    n = n+1;
    xy(:,n) = [xi; yi];
end
%% Interpolating with a spline curve and finer spacing
    t = 1:n; ts = 1:0.1:n;
    xys = spline(t, xy, ts);
%% Plot the interpolated curve
    plot(xys(1,:), xys(2,:), 'b-'); hold off
```

[X,Y] = ginput(N) gets N points from the current axes and returns the x- and y-coordinates in length N vectors X and Y (data points are entered by pressing a mouse button or any key on the keyboard except carriage return, which terminates the input before N points are entered.)

[X,Y,BUTTON] = ginput(N) returns a third result, BUTTON, that contains a vector of integers specifying which mouse button was used (1,2,3 from left).
```matlab
ellipsoid(0, 0, 0, 2, 10, 1, 40), hold
[x, y, z] = cylinder(0.5, 40); axis equal
surf(0.8*x, 3*y, 1.5*z + 0.5)
shading interp
light('Co', 'y', 'Po', [-4 0 -2], 'St', 'lo')
material metal
set(gca, 'Visible', 'off'), colormap jet

uicontrol('Style', 'pushbutton', 'String', 'Zoom In', ...
'Position', [20 20 80 30], ...
'Callback', 'if camva <= 1; return; else; camva(camva-1); end');
uicontrol('Style', 'pushbutton', 'String', 'Zoom Out', ...
'Position', [100 20 80 30], ...
'Callback', 'if camva >= 179; return; else; camva(camva+1); end');
```

E-Books and Code by Cleve Moler

Numerical Computing

Experiments with MATLAB

Exploring Matrices Exercises

Requirement to Engineering Plots

- Choose the **type** of the plot and its **scale** wisely to have the best possible (that is, readable and understandable) representation of what you intend to show by this plot
- Use a **title** to identify what the plot is, especially when there are multiple plots of a similar type
- **Label** each axis and show the units used (place them in parentheses or after a comma right after the axis’ title and be consistent for all the plots)
- Add **annotations** including visualizing equations, indicating specific parameters, adding basic data statistics, as necessary
- Assure that each axis has regularly spaced **tick marks** at convenient intervals to allow quick estimates of values
- Distinguish each line not only by a different color (which MATLAB does for you automatically) but also by a **different line style** (and/or marker). While you can see the difference between the colored lines on the screen, it may disappear when the plot is printed out on a monochrome printer or converted into grayscale in a journal publication
- Place a **legend** distinguishing and explaining different curves
- Do not overload one plot by placing too much information on it, so if appropriate, use **multiple axes**
- **Measured data** are usually represented by markers at each data point (different symbols then can be used for different sets of data). Connecting the data points assumes a relationship in data that may not exist
- On the contrary, **equations** are usually plotted as lines, not as individual data points
The End of Chapter 6
